

The Handler is used for the management of the roll and core movement throughout an entire production area. The main characteristic is that it may be applied to normal industrial cranes with a very reduced economic impact.

Main characteristics:

"Rapid" roll coupling system

0° ÷ 180° roll rotation (upon request) which allows:

1. interlocking with perpendicularly positioned production systems
2. the change of direction of the unwinding of the film

Functional and safety interlocks with production equipment (winder, slitter).
