

Machine destined for the horizontal movement of devised rolls. Used in the roll movement phase in the packaging or secondary working area.

Main characteristics:

- Rigid vertical guide
- "Protruding shaft" coupling system, interchangeable according to internal diameters
- Facilitated coupling and uncoupling
- Controlled, mechanised roll rotation
- Possibility of descent restraint during placement into the machine
- High operational productivity and adaptability with direct management by the operators
- Drastic reduction of paletting time and of personnel necessary.
