

Modular roll-movement machine able to satisfy, in its various configurations, from the single load/unload roll in the metalliser, to the totally automated management of a metallisation and secondary cut department (withdraw roll from primary slitter, temporary storage, interlocking with the mettipalo (pole insertion), metalliser and secondary slitter). The RP9 is characterised by guided vertical movements to avoid oscillations and collisions with other materials and systems; differentiated fastening systems material in function of the specific operational necessity (hook clamp, hooking pliers rotation, etc.); safety interlocking with production systems. May be supplied in a manual, semi-automatic or completely automated operation mode.
