

BONFANTI shuttles transport rolls along the floor between different production areas without creating fixed constraints; they are also used as unloading elements for production equipment. They are available in various versions: from the basic (shuttle with motorization only for longitudinal movement) to those more evolved with motorised movements for longitudinal displacement, roll reception and expulsion, two-level transfers, etc. The shuttles are prepared for operation in conjunction with the other BONFANTI systems; in addition, they are equipped with opportune safety elements to avoid collisions with people, material, and moving means of transportation. There are various operational modes: manual, semi-automatic and automatic.
